Reliable and Reproducible

Our problem-solving framework will help you produce results that are **reliable** (so that your findings are more accurate) and **reproducible** (so that others can follow your steps and achieve the same results).

Note that, depending on the problem you're trying to solve, the Data Science Workflow will not always be linear. You may have to repeat some steps before drawing any conclusions!

We'll explore these steps through an example project in the following slides.
