Knowledge Check

Which of the following is the core difference between GitHub and GitHub Enterprise?

Select the best answer.

- ☐ GitHub Enterprises are privately owned and maintained by individual groups. 

Correct: One of the best ways to think about GitHub Enterprise is as the exact same system as GitHub, except with access and ownership controlled by a private group. All GitHub-related issues are still possible within a GitHub Enterprise. Just because you are invited to join a GitHub Enterprise does not mean you have access to all of the repos it contains — admins and owners have to give you permission to work on specific repositories. You can still create private repositories on GitHub that are not visible to anyone (although this sometimes costs money).

- ☐ GitHub Enterprise allows you to create private repositories; GitHub does not.
- ☐ File size issues and merge conflicts are only possible while using GitHub, not GitHub Enterprise.
- ☐ All members of a GitHub Enterprise instance can access and modify all repos within it.
