Creating a GitHub Repository: Part I

We've come a long way! So far, we've:

1. Created a local Git repository for your project.
2. Added files to your Git repository.
3. Made and committed changes.

Now, let's create a **remote** repository for our project using GitHub.com. You'll need to either log in to GitHub if you have an account or [create one](#) if you don't.

Once logged in, you'll , click the "+" sign next to your avatar at the top right of your screen, followed by "New repository:"

Under "Repository name," give your project a **URL-friendly** name. Project names should be one word (you can use hyphens or spaces to separate words). We'll call ours `example1` to keep it consistent with our project directory.

You can add a project description if you want. I personally never do.

Click the green “Create repository” button to proceed to the next screen.
