## Command: Move File (mv)

To simply move a file from one directory to another, rather than copying and pasting it, you can use the `mv` command.

Similar to `cp`, this command needs us to tell it which file to move and where to put it. Again, you can use either relative or absolute paths here.

To use this command, you would type: `mv [original filename] [location to send file]`.

Let's try it with the `blank.txt` file. First, navigate back to your desktop. Next, move the file into your `general_assembly` folder by typing:

```
mv blank.txt ../general_assembly
```
