Command: List Directory Contents (ls)

When you open up your CLI, it can be helpful to list all of the files and folders in your current directory to remember where you are. To do this, we would use:

```
ls
```

For example, to list all of the files and folders in your home directory, you would type:

```
ls ~
```

Windows users: If you were using the Windows Command Prompt (as opposed to a UNIX terminal or `gitbash`), you would type `dir` instead of `ls`. This lists the files and folders in your local directory.

Try this on your own desktop.
