Making Changes to Files

At this point, we have a few pages for our website (our files — `about`, `contact`, and `home`) but they're all empty. Next, we'll add some text to our files and perform another commit. You can always make changes in the text editor of your choice, but to speed things along we'll do this in the terminal.

To add some text to your `home.html` page, type the following in the terminal:

```
echo "This is my home page. There are many like it, but this one is mine." >> home.html
```

If you were to open `home.html` in your browser, you'd see:

This is my home page. There are many like it, but this one is mine.

Now, add some text to `contact.html`:

```
echo "Contact me." >> contact.html
```
