Installing Git

Alright, enough theory. Let's "git" our hands dirty and learn some Git. Before we dive in, you'll need to install Git on your computer.

For Macs:

1. Install Homebrew. Homebrew helps Mac users install various open-source libraries (Python, Git, etc.) with ease. You can read more about Homebrew on its site.
2. Once Homebrew is installed, open your terminal and run the following: `brew install git`.

For PCs:

1. Download and install Git from the official Git website. The download should happen automatically.
2. Once you've installed Git, hit `Windows key`.
3. Type `git bash`.
4. Press `enter`.

Moving forward, Mac users will be working in terminal and PC users will be in Git Bash.
